

# Water Cycle

## Cut-and-sequence Cards

Cut out the cards. Put them in the correct order to show the water cycle.

### 1 Evaporation

Sun heats water in lakes, rivers and oceans. The water turns into water vapour and rises into the air.

### 2 Condensation

Water vapour cools in the air and changes back into tiny water droplets. These droplets form clouds.

### 3 Precipitation

When the droplets in the clouds get too heavy, they fall to Earth as rain, snow, sleet or hail.

### 4 Collection

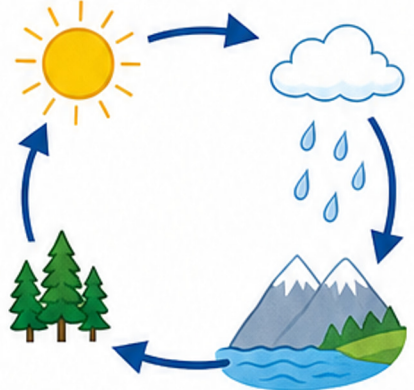

The water collects in rivers, lakes and oceans. Some water also soaks into the ground.

### 5 Runoff

Water flows over the land into streams and rivers. It returns to lakes and oceans.

### 6 Back to Start

The sun heats the water again and the cycle starts over.

★ The water cycle never stops! ★
